MOST IMPORTANT RESEARCH ACHIEVEMENTS

- Matter wave interferometry with neutrons, atoms, buckyball molecules
- Discovery of three-particle entanglement as an extreme demonstration of quantum nonlocality. The so-called GHZ-states (Greenberger-Horne-Zeilinger) and their generalizations have become a cornerstone in the development of quantum information science and quantum computation
- First experimental realization of quantum teleportation of a single independent photon
- Theoretical concept of entanglement swapping and its first experimental verification. This is a fundamental ingredient for future quantum repeaters
- Long-distance realizations of quantum communication and of loophole-free tests of Bell's Inequality
- First experimental realization of entanglement-based quantum cryptography
- Realization of many gates and procedures for optical quantum computation

PROFESSIONAL INITIATIVES BEYOND PHYSICS
